

OnChainAlpha (OCA) Grant Proposal: The Verified On-Chain Trading Insights Hub on Solana

A Comprehensive Proposal for Solana Labs Grant Program

Executive Summary

OnChainAlpha (OCA) is a **Decentralized Application (dApp)** being built on **Solana** to establish the world's most transparent and verifiable social trading hub. We solve the pervasive problem of untrustworthy trading signals and opaque performance records by bringing every analyst's win rate and analysis outcome **on-chain**. OCA bridges Social Trading, DeFi incentives, and On-Chain Data into a single DApp.

Key Metrics	OCA Solution
Problem Solved	Lack of trust in trading signals & unverified analyst track records.
Solution	A Solana dApp that tracks performance and verifies win rates on-chain .
Core Platform	Solana
Reward System	Dual Reward: USDC for Top 1-10 Analysts & \$OCA for Top 11-100.
Grant Request	\$125,000 USD (Detailed in Section 5)

1. Problem, Solution, and Market Analysis

1.1 The Problem Statement

Crypto trading is plagued by noise, fake signals, and unverified "gurus". Existing platforms (Telegram, Twitter, TradingView) are **off-chain**, lack transparent track records, and are generally reward-free for proven analysts. This forces traders to struggle to filter quality insights from noise.

1.2 The OCA Solution

OCA is a decentralized application (DApp) on Solana designed to enforce transparency and incentivize skill. We allow analysts to publish pair-specific analysis, track performance on-chain, create leaderboards updated in real-time, and reward top analysts. Our **Verified Win Rates** mean all analysis outcomes are recorded immutably on-chain.

1.3 Competitive Advantages and Differentiators

OCA's primary competitive advantage is **immutability and verifiable truth**—something traditional competitors like TradingView, Telegram signal groups, and centralized social trading platforms fundamentally cannot offer.

1. **On-Chain Verification:** Every analysis outcome is recorded on the Solana blockchain and verified against Oracle data, making win rates tamper-proof. This establishes unprecedented trust for traders.
 2. **Dual Reward & Tokenomics:** Our incentive structure is a major differentiator. Analysts are incentivized by a sustainable **Dual Reward System**, receiving **USDC** (stable income) and **\$OCA** (governance/growth) based on their verified performance.
 3. **Solana Performance:** Building on Solana allows us to offer **real-time leaderboards** updated frequently with minimal cost, which is essential for a fast-moving trading product.
-

2. Technical Deep Dive (Solana Architecture)

2.1 Why Build on Solana?

We chose **Solana** because its technical capabilities directly address our dApp's core requirements: **Low Latency** for real-time leaderboard updates, **High Throughput** for frequent data updates, and **Low Transaction Costs**—allowing analysts to post and update analyses frequently without incurring high fees.

2.2 Program Structure and Verification Logic

The core logic will be developed using **Rust** and the **Anchor Framework**.

Component	Technical Implementation
Alpha Verification Mechanism	The smart contract will integrate with a reliable Solana Oracle (e.g., Pyth Network) . The program queries the oracle for the final price to automatically and verifiably determine if the target was hit.
Dual Reward Contract	Handles the automatic proportional distribution of 80% of Premium Fees in USDC to the Top 1-10 Analyst Accounts.

Token Buyback Mechanism	A dedicated function triggers an <i>on-chain swap</i> of 10% of the premium USDC revenue to automatically buy back \$OCA and distributes it to Top 11-100 Analysts.
--------------------------------	---

3. Execution Plan and Team

3.1 Project Team

The OCA team possesses the necessary expertise in Solana development and crypto market strategy to execute this project successfully.

Name	Role	Core Expertise
Rendi	Lead Developer & Product/Strategist	Deep expertise in Rust/Anchor/Solana Development and Product Strategy.
Febryand Artansyah	Co-Lead Developer	Strong background in Rust/Anchor/Solana Development and smart contract security.
Timothy	Marketing & Community Lead	Proven experience in Building Crypto Community and driving dApp adoption.

3.2 Detailed Roadmap

Our roadmap focuses on delivering a secure, audited MVP first.

Phase	Timeline Target	Key Deliverables (Milestones)
Phase 1: Foundation	Q4 2025	Smart Contract Core Development. Integration with Pyth Oracle. Mandatory Third-Party Security Audit.
Phase 2: Beta & Launch	Q1 2026	Beta Launch dApp Frontend. Implementation of Premium Tier. Token Launch (\$OCA). Initial Reward Distribution.
Phase 3: Scaling	Q2 2026	Launch of Staking and Governance features. NFT Badges.

4. Grant Request Breakdown

We request a grant of **\$125,000 USD** to cover the critical, non-negotiable costs required to complete the core development (Phase 1) and ensure the project is launched securely and professionally on Solana.

Expense Category	Requested Amount (USDC)	Justification & Milestone Achieved
Milestone 1: Smart Contract Core Development	\$50,000	Finalization and testing of the full Anchor Program suite (Verification, Reward, Token Contracts).
Milestone 2: Mandatory Third-Party Security Audit	\$35,000	Security Audit of V1 Smart Contracts by a reputable Solana security firm (Crucial for user fund safety).
Milestone 3: Frontend MVP & Integration	\$25,000	Development of the initial dApp interface, Wallet integration, and Leaderboard data visualization.
Oracle Integration & Infrastructure	\$15,000	Deployment fees, premium access to RPC services, and Pyth Network integration.
TOTAL GRANT REQUEST	\$125,000	Total capital required to launch a secure, audited MVP on Solana.

5. Public Good Contribution

OCA generates a significant public good for the Solana ecosystem by providing **decentralized, verifiable data** and promoting transparency.

1. **Free and Verifiable Public Data:** The core function of the platform—the **Leaderboard**—will be free to view. Any user can publicly verify the track record of any analyst before paying for premium insights.
2. **Open Source Contribution:** We commit to **open-sourcing** the core Smart Contract (Anchor/Rust Program) code after the successful completion of the security audit (Milestone 2). This allows other Solana developers to audit, learn from, and build on top of our code.
